## Dreissenid Mussel Survey (2011): Onondaga Lake and the Seneca River

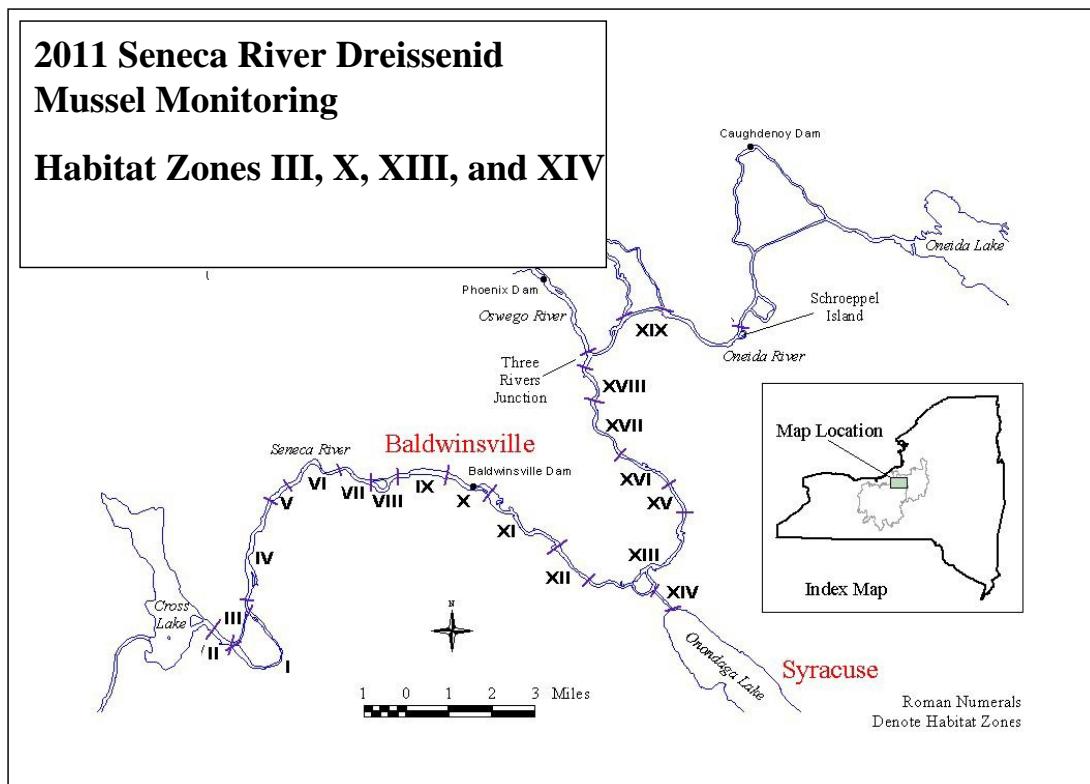

During the fall of 2011, OCDWEP staff completed the Onondaga Lake and Seneca River dreissenid mussel survey in support of the model development and/or validation needs for the Three Rivers Water Quality Model (TRWQM) and Onondaga Lake Water Quality Model (OLWQM). The survey included both zebra mussels (*Dreissena polymorpha*) and quagga mussels (*Dreissena bugensis*).

### A6-1 Seneca River

The October 3, 2011, monitoring event included the collection and estimation of dreissenid mussels within habitat zones identified by Beak Consultants during the 1999 Seneca River Dreissenid Mussel Assessment Program, and key locations recommended by AnchorQEA to provide a measure of length frequency distribution, density (#/m<sup>2</sup>) and biomass (g/m<sup>2</sup>). The monitoring locations include the following four (4) habitat zones:

- Zone III – State Ditch Cut – 3 Transects, 3 samples per transect.
- Zone X – Near the Baldwinsville Dam – 3 Transects, 3 samples per transect.
- Zone XIII – Near Klein Island – 5 Transects, 3 samples per transect.
- Zone XIV – Onondaga Lake Outlet– 2 Transects, 3 samples per transect.

*Map of General Seneca River Dreissenid Mussel Transect Locations*

Three (3) samples were collected along each transect, consisting of a cross-section of the river. One (1) at approximately mid-channel (Middle), and one (1) between the channel marker buoy

and shoreline on each side of the river (Red and Green). A single grab sample was collected at each depth interval with a petit ponar dredge, which has a sample area of 35 in<sup>2</sup> (226 cm<sup>2</sup>).

Once at the surface, all substrate within the sampler was carefully placed into the wash bucket with a mesh screen. Lake water was used to rinse any remaining material into the wash bucket. Fine sediments were rinsed through the wash bucket, and all remaining material was placed in a labeled zip-lock bag. At each monitoring location technicians record the date, time, water depth (ft), general weather conditions, and GPS coordinates at the mid channel location. Following field sample collection, all samples were placed in a cooler with ice until transported to a refrigerator at the HCBF laboratory .

Thirty-nine (39) samples were collected from the Seneca River during the 2011 field effort.

## A6-2 Onondaga Lake

The October 18, 2011, monitoring event on Onondaga Lake included the collection and estimation of dreissenid mussels within habitat zones identified by Stantec during the 2002 Onondaga Lake Zebra Mussel Assessment Program, and transects and water depth intervals recommended by AnchorQEA in 2005. In 2011 to determine if dreissenid mussels were found in deeper water an additional sample (4.5 – 6.0 m) was collected in each transect. The recent efforts provide a limited measure of length frequency distribution, density (#/m<sup>2</sup>) and biomass (g/m<sup>2</sup>) in Onondaga Lake. The monitoring locations include the following eight (8) habitat zones:

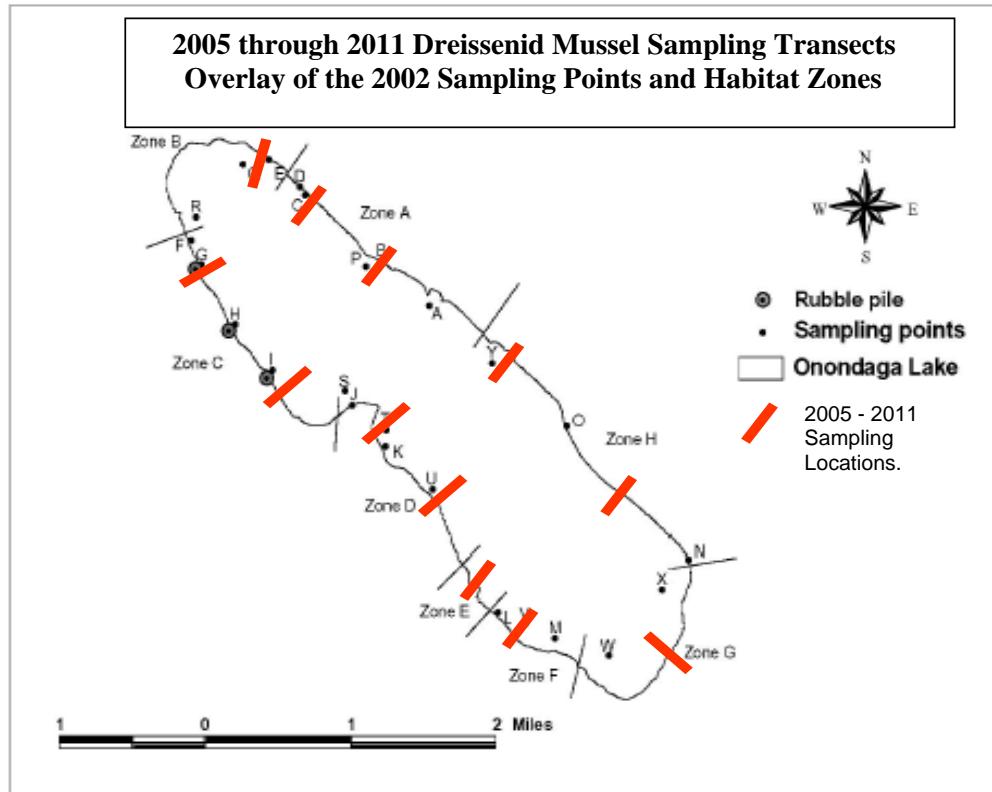

- Zone A – 2 Transects, 3 samples per transect, at 0-1.5 m, 1.5 – 3 m, and 3 – 4.5 m, 4.5 – 6.0 m
- Zone B – 1 Transect, 3 samples per transect, at 0-1.5 m, 1.5 – 3 m, and 3 – 4.5 m, 4.5 – 6.0 m
- Zone C – 2 Transects, 3 samples per transect, at 0-1.5 m, 1.5 – 3 m, and 3 – 4.5 m, 4.5 – 6.0 m
- Zone D – 2 Transects, 3 samples per transect, at 0-1.5 m, 1.5 – 3 m, and 3 – 4.5 m, 4.5 – 6.0 m
- Zone E – 1 Transect, 3 samples per transect, at 0-1.5 m, 1.5 – 3 m, and 3 – 4.5 m, 4.5 – 6.0 m
- Zone F – 1 Transect, 3 samples per transect, at 0-1.5 m, 1.5 – 3 m, and 3 – 4.5 m, 4.5 – 6.0 m
- Zone G – 1 Transect, 3 samples per transect, at 0-1.5 m, 1.5 – 3 m, and 3 – 4.5 m, 4.5 – 6.0 m
- Zone H – 2 Transects, 3 samples per transect, at 0-1.5 m, 1.5 – 3 m, and 3 – 4.5 m, 4.5 – 6.0 m

Four (4) samples were collected along each transect at water depths between 0 to 1.5 meters, 1.5 to 3.0 meters, 3.0 to 4.5 meters, and 4.5 to 6.0 meters. A single grab sample was collected at each depth interval with a petit ponar dredge, which has a sample area of 35 in<sup>2</sup> (226 cm<sup>2</sup>).

Once at the surface, all substrate within the sampler was carefully placed into the wash bucket with a mesh screen. Lake water was used to rinse any remaining material into the wash bucket. Fine sediments were rinsed through the wash bucket, and all remaining material was placed in a labeled zip-lock bag. At each monitoring location the technicians recorded the date, time, actual water depth (ft), general weather conditions, and GPS coordinates. Following field sample collection, all samples were placed in a cooler with ice until transported to refrigerator at the HCBF laboratory .

Forty-eight (48) samples were collected in Onondaga Lake during the 2011 field effort.

## Map of General Onondaga Dreissenid Mussel Transect Locations

### A6-3 River and Lake Biological Laboratory Processing

At the HCBF biological laboratory, all mussels in the sample were carefully removed from the substrate material. Laboratory measurements of the collected samples were completed within two (2) weeks of sample collection. The entire sample was sorted to separate the live mussels from the shell fragments. Care was taken to distinguish between zebra and quagga mussels that are similar in appearance for young-of-year mussels. The mussels were then blotted dry with paper towels.

#### A6-3.1 Length Frequency

Technicians randomly select 100 mussels from the sample for length measurement. Using the digital caliper, the technicians recorded the length of each mussel (nearest 1 mm) on the Log Sheet for Mussel Length. If a sample results in less than 150 mussels for any given transect (because of the lack of mussels in some individual samples), additional randomly selected mussels were then measured in those samples within the transect with more than 100 mussels (if such were available), with the goal of at least 150 measurements per transect.

### **A6-3.2 Weight and Density Determination (Estimate)**

Upon completion of the length measurements for the sample, technicians used the 100 randomly selected mussels (or using all the mussels samples that were measured for those sample locations that did not contain 100 mussels) for a batch weigh per sub-sample. Technicians recorded the number of mussels in the sub-sample and the weight of the sub-sample on the Log Sheet for Weight and Density Determination (weight was recorded to the nearest 0.1 grams). The technicians then combined the sub-sample mussels with the remaining mussels in the sample for a total weight for the entire sample. The calculation for the estimated total number of mussels per sample as follows:

$$\text{Total # of Mussels per Sample} = \frac{(\# \text{ mussels per sub-sample} * \text{weight per entire sample})}{\text{weight per sub-sample}}$$

### **A6-4 Seneca River Data**

On October 3, 2011, OCDWEP technicians collected the dreissenid mussel samples at the designated locations. Samples were collected and measured in accordance with the standard procedures unless otherwise noted. In general, the locations sampled contained a significant quantity of dreissenid mussel shell fragments requiring considerable laboratory effort to distinguish between the dead and live mussels.

During 2011, the survey identified that all four (4) zones sampled contain zebra mussels, and three (3) of the four (4) zones sampled contained quagga mussels. Twenty-one (21) of the thirty-nine (39) individual samples collected contained zebra mussels, and ten (10) of the thirty-nine (39) individual samples collected contained quagga mussels.

Zebra mussels were identified in all transects sampled in 2011 except two (2), Zone X Transect A and B. Zebra mussels represented nearly 76% (by number) and 23% (by biomass) of the Seneca River dreissenid mussels sampled, and nearly 60% (by number) and 21% (by biomass) of the Lake Outlet dreissenid mussels sampled.

Quagga mussels were identified in transects near Kline Island (Zone XIIIB and XIIIE), both of the Lake outlet transects (Zone XIVA and XIVB), and the State Ditch Cut (Zone IIIB). The Quagga mussels represented 24% (by number) and 77% (by biomass) of the Seneca River dreissenid mussels sampled, and nearly 40% (by number) and 79% (by biomass) of the Lake Outlet dreissenid mussels sampled.

The Seneca River and Onondaga Lake outlet monitoring has continued to identify fluctuating dreissenid mussel densities (refer to Table A6-2), particularly in the Onondaga Lake outlet. While the zebra mussel is the most prevalent species in the Seneca River by numbers, it is being displaced by the quagga mussel in the Onondaga lake outlet. Since quagga mussels were first observed in the lake outlet in 2007 they have increased from 4% of the total population to 61% in 2010 and 40% in 2011. This shift in dominance is most apparent in biomass estimates in which quagga mussels have comprised over 79% of the total biomass since 2009. Additionally, zebra mussel densities reported in 2011 from the State Ditch Cut (Zone III) were the lowest reported

since 2004. Zebra mussels that were collected from the State Ditch Cut (Zone III) were small, averaging 4.3 mm in length.

The observed dreissenid mussel population variations in the lake outlet and the Seneca River are difficult to attribute to any one factor. Nutrient levels, water flows, changes in water quality, sampling gear, and annual variability in populations are all possible contributing factors.

Note: The 2004 data utilized scuba divers for sample collection, and the 2005 through 2011 data utilized the petit ponar dredge for sample collection.

#### A6-5 Onondaga Lake Data

On October 18, 2011, OCDWEP technicians collected the dreissenid mussel samples at the designated locations. Samples were collected and measured in accordance with the procedures unless otherwise noted. In general, most locations sampled contained a significant quantity of dreissenid mussel shell fragments requiring considerable laboratory effort to distinguish between the dead and live mussels.

During 2011, the survey identified that all eight (8) zones sampled contain zebra mussels, and seven (7) of the eight (8) zones sampled contained quagga mussels. Forty-one (41) of the forty-eight (48) individual samples collected contained zebra mussels, and twenty-five (35) of the forty-eight (48) individual samples collected contained quagga mussels.

Zebra mussels were identified in all transects, and represented nearly 49% (by number) and 21% (by biomass) of the Onondaga Lake dreissenid mussels sampled. Quagga mussels were identified in all transects except one (1), which encompassed the southern most portion of Onondaga Lake (Zone G). The Quagga mussels represented 51% (by number) and 79% (by biomass) of the Onondaga Lake dreissenid mussels sampled.

The Onondaga Lake monitoring has continued to identify fluctuating dreissenid mussel densities (refer to Table A6-5a and Table A6-5b), and a shift in 2011 from zebra mussels as the most abundant *Dreissena* sp. to quagga mussels. Zebra mussels were the most abundant species reported in 2007, 2008, and 2010 however, in 2009 and 2011 quagga mussels displaced the zebra mussel as the most abundant species (Table A6-5a). Sampling efforts in 2009 and 2011 reported biomass estimates of quagga mussels 3 – 7 times greater than those reported for zebra mussels (Table A6-5b).

Quagga mussel densities and biomass in 2011 were highest in Zones B, C and D located on the north end and west side of Onondaga Lake. In contrast zebra mussel densities were highest in zones B, C and E located at the north end and southwest side of Onondaga Lake (Table A6-5a and Table A6-5b). Lake wide biomass estimates of dreissenid mussels in 2011 (0 – 6 m) was 588.95 (g) per m<sup>2</sup>. To better compare 2011 lake wide biomass estimates of dreissenid mussels biomass estimates to previous years the 4.5- 6.0 m samples were excluded. Biomass estimates from (0 - 4.5 m) in 2011 were 490.45 (g) per m<sup>2</sup> lower than those reported in 2007 – 2010 (Table A6-7a and Table A6-7b).

The observed dreissenid mussel population variations in Onondaga Lake are difficult to attribute to anyone factor. Nutrient levels, wave action, changes in water quality, sampling gear, and annual variability in populations are all possible contributing factors.

Note: The 2002 data utilized scuba divers for sample collection, and the 2005 through 2011 data utilized the petit ponar dredge for sample collection

**Table A6-1. Seneca River Dreissenid Mussel Survey Fall 2011 – Length and Weight Data Summary**

Zone	Transect	Transect Coordinates	Channel Location	Water Depth (m)	(A) Number of Mussels Per Sub-Sample		(B) Weight Per Sub-Sample (g)		(C) Weight Per Entire Sample (g)		Total Weight (g/m <sup>2</sup> )		Mean Weight (g/m <sup>2</sup> ) per Transect		Median Mussel Length (mm)		Mean Mussel Length (mm)		Total Number of Mussels Per Sample		Estimated Total Number of Mussels per m <sup>2</sup>		Mean Estimated Number of Mussels per m <sup>2</sup> by Transect
