Figure A8-2. Whole lake electrofishing relative abundance in 2011.

Note: CPUE (catch per hour) for gamefish (bolded) is calculated from all 24 transects.
CPUE for non-gamefish are calculated from only the one-half of the transects where all
fish are collected (every other transect). Because of the difficulty in netting clupeids (shad
and alewives), the CPUE for these species is calculated from a combination of fish that
are boated and estimates of the number of fish missed. Because of their large size carp are
not boated, instead carp within netting distance are counted while still in the water.
